3 Abstract:

4

5 --Methods and apparatus determine the location of a peripheral, such as a
6 multi-function peripheral. A method comprises the steps of sending a first message
7 to the peripheral server, wherein the first message is formatted as a print job and
8 contains an address of the client; and receiving at the client a second message
9 containing the peripheral address. An apparatus comprises a client computer, a
10 peripheral server and a peripheral. The peripheral server receives a first message
11 from the client computer. The first message is formatted as a print job and contains
12 an address of the client computer. The peripheral receives the first message from
13 the peripheral server and notifies the client computer of the peripheral's address.
14 The client computer can thereafter access a non-printer function of the peripheral
15 using the peripheral's address and without using the peripheral server.—
